Minimising the Risks of Swine Flu

Catch it. Bin it. Kill it.

Q. What is swine flu?

A. Swine flu is a respiratory disease and has some elements of a virus found in pigs. Swine flu is spreading from human to human, which has led to what is referred to as a pandemic flu outbreak. Because it's a new virus, no one will have immunity to it and everyone could be at risk of catching it. *

Q. How does it spread?

A. Flu viruses are made up of tiny particles that can be spread through the droplets that come out of your nose and mouth when you cough or sneeze. When you cough or sneeze without covering your nose and mouth with a tissue, those droplets can spread and others will be at risk of breathing them in. If you cough or sneeze into your hand, those droplets and the germs in them are then easily spread from your hand to any hard surfaces that you touch, and they can live on those surfaces for some time. *

Q. What precautions should your business take?

A. To protect your employees and customers it is important to follow good hygiene practices as these will help to slow the spread of the virus. It is recommended that when someone coughs or sneezes they use clean tissues to cover their nose and mouth, they should then dispose of the tissue in a bin and wash their hands with soap and hot water or a sanitizer gel. Hard surfaces should be cleaned and disinfected regularly. *
